

Hackathon Submission: GlobalSave

Name

GlobalSave

Description

A decentralized application on Monad designed to facilitate secure, transparent, and efficient collaborative finance for global users, addressing high cross-border fees, lack of trust in shared funds, and limited yield opportunities.

Problem

Collaborative financial activities (e.g., shared expenses, group savings) for international users are hindered by high cross-border transaction fees and delays, a lack of transparency and trust in managing shared funds, and the erosion of savings value due to low-yield traditional accounts. Manual processes are inefficient and burdensome.

Solution

GlobalSave leverages Monad's high-performance blockchain to provide an onchain immutable ledger for group contributions and expenses, multi-signature fund management, and automated rules for payouts. It includes a unique "Dispute Resolution & Fund Lock" mechanism for community-driven security and optional integration with DeFi protocols for yield generation. The user-friendly interface supports multi-currency interactions for a global audience.
